Symbols

2SLS 204–206
  assumptions for instruments . . . 204
  balance test 207
  exogeneity test 206
  F test 206
  GMM estimation 216
  overidentifying restriction test 207
  specification test of instrument strength 206
  specification tests 206–207
  standard errors compared with OLS 206

2SRI
  control functions 207, 209
  functional form 216
  linear models 207–209
  linear models versus nonlinear models 209, 216
  nonlinear models 210–216

A

actual outcomes
  comparison between two-part and generalized tobit models . . 126, 128
  generalized tobit models 122
  two-part models 106, 116, 122, 128

Agency for Healthcare Research and Quality . . . . . *see* AHRQ

AHRQ 23, 30, 32

AIC 19–20, 66–69, 85–87, 91, 181
  comparison of NB1 and NB2 . . . 148
  count models 160–161

AIC, *continued*
  does not suffer from multiple testing 69
  example where differs from BIC . . 69
  FMM 175
  MLE formula 19, 160
  OLS formula 20
  robustness 20

Akaike information criterion . . . *see* AIC

`at((mean) _all)` option 141

ATE 9–17, 21
  estimation 10–13
  laboratory experiment 11
  `margins` and `teffects` commands 43, 45
  OLS 41, 42

ATET 10–16, 41, 42, 45
  count models 140
  OLS 42

average treatment effect on the treated . . . . . *see* ATET

average treatment effects . . . . . *see* ATE

`aweights` 223, 226

B

balance tests, 2SLS 207

Bayesian information criterion . . . . . *see* BIC

`bcskew0` command 102

`bfit` command 70

BIC 19–20, 66–69, 85–87, 91, 181
  comparison of NB1 and NB2 . . . 148
  count models 160–161
  does not suffer from multiple testing 69
  example where differs from AIC . . 69
  FMM 175

BIC, *continued*
MLE formula 19, 160
OLS formula 20
robustness 20
bootstrap
adjustment for clustering 227
intuition 227
nonparametric regression 194
standard errors 227
`bootstrap` command 91, 227
`boxcox` command 87, 91, 102, 132
Box–Cox models 87, 93, 101–102
example 101–102
formula 101
skewness 101
square root model 101
two-part model, second part in 112

C

CDE 3, 166, 198–200
estimate with one logit model . . 199
fit with series of logit models . . 199
flexibility for different distributions 199
for count models 199
heterogeneity across bins 199
homogeneity within bins 199
intuition 198
relation to two-part models . . . 199
two key assumptions 199
censoring
causes 159
comparison with truncation . . . 129
count models 158–159
definition 129
formulas 159
right-censoring 130
centaur 128
`centile` command 71
`cfunction` option 219
chain rule 119
clusters 223–224
affect standard errors 225
bootstrap 227
clusters, *continued*
in natural experiments 225
jackknife 227
PSU 223
standard-error formula 224
`cnreg` command 132
`codebook` command 228
complex survey design . . . . . *see* design effects
conditional density estimators . . . . . *see* CDE
conditional independence assumption . . . . . *see* ignorability
confounders 201
consistency
GLM 75
negative binomial models 145
Poisson models 136, 138, 139
`contrast()` option . . . 41, 42, 45, 70, 84
`contrast` postestimation command . . 91
control functions 201
2SRI 207, 209
functional form 209
functions of residuals 216
nonlinear functions 209
count data 2
count models 3, 5, 133–163
AIC 160–161
AIC and BIC 148, 160
BIC 160–161
censoring 159
cross-validation 161–163
discreteness 133
event counts 134
event counts for NB1 and NB2 . . 148
FMM 186
hurdle count models 149–155
model comparisons 159
model selection . . 148, 158, 160–163
model selection examples 160
negative binomial models 144–149
Poisson models 137–138
skewness 133

count models, *continued*
truncation 158–159
zero-inflated models 155–158
counterfactual outcome 9–11
cross-validation 8, 20
comparison with repeated random subsampling 161
count models 161–163
Current Population Survey 228

D

data-generating process
generalized tobit 112
hurdle or two-part model 150
negative binomial 145
Poisson distribution 133, 142
potential outcomes 9, 10
two-part model 112
delta-method standard errors . . 41, 227
dental expenditures
generalized tobit model examples 123
two-part model example 123
`describe` command 32
design effects 3, 5, 7, 24, 221–235
clusters 223–224
examples 228–234
inference 225–227
point estimation 225–226
standard errors 221, 226–227
stratification 223–224
survey design setup 228–229
weighted Poisson count model 233–234
weighted sample means . . . 229–231
weights 223
WLS 231–233
`detail` option 32
difference-in-differences
standard errors 222, 225
with clusters 225
`difficult` option 186
discreteness, count models 133
`dispersion(constant)` option 147
`dispersion(mean)` option 146
Duan's smearing factor 97, 98, 101
Abrevaya's method, relation to 101
formula 97
dummy variable interpretation
Kennedy transformation 95, 96
log models 95

E

economic theory 1
EEE 91
`eintreg` command 216
endogeneity 3, 5, 21, 33, 201–219
2SLS 204–206
example with artificial data . . . 202
examples 201
linear models 202–210
nonlinear models 210–216
OLS is inconsistent 202–204
omitted variables 201
`eoprobit` command 216
`eprobit` command 216, 219
`eregress` command 209, 210, 213, 216, 219
`probit` option 210, 213
ERM 209–210
normality assumption 209
error retransformation factor 96–98
`estat`
`lcprob` command 178, 181
`firststage` command 206
commands 219
`endogenous` command 207
`gof` postestimation command . . . 60
`ic` command 163, 181
`ovtest` postestimation command 63, 70
`estimates estat` command 91
`estimates stats` command . . . 70, 163
`etregress` command 219
exogeneity test, 2SLS specification test 206
`expression()` option 152, 153, 172
extended estimating equations . . . . . *see* EEE

extended regression models . . . *see* ERM
extensive margin, two-part models 105, 119, 128

F

F test, 2SLS specification test 206
FIML 209
comparison with LIML 111
convergence failure 123
formula for generalized tobit model 110
generalized tobit models . . 110–111
Heckman selection models 110–111
finite mixture models . . . . . *see* FMM
`first` option 205
FMM 3, 166, 173–192
AIC and BIC 175
density formula 174
distribution choice 174
example of count models 186
example of healthcare expenditures 176–186
example of healthcare use 186–192
formula for posterior probability 175
identification 175
incremental effects 183, 191
interpretation of parameters . . . 175
marginal effects 183, 191
motivation 173
predictions of means 182
predictions of posterior probabilities 184
theory 175
two-component example 176
`fmm9` package 200
`fmm` command 176, 178, 192, 200
`fmm` prefix 176
Fuchs Award, Victor R. v
full-information maximum likelihood . . . . . *see* FIML
`fweights` 223

G

Gauss–Markov theorem 33
generalized linear models . . . . . *see* GLM
generalized method of moments . . . . *see* GMM
generalized tobit models 109–111
actual outcomes 122
censoring assumption 109
censoring formulas 109
comparison of FIML and LIML . . 111
comparison with two-part models 111–116
correlation of errors 109, 110
example comparing with two-part model 122–128
examples showing similar marginal effects to two-part models 112–116
exclusion restrictions 110, 112
FIML and LIML 110–111
formula for FIML 110
formula for LIML 110
formulas 109–110
identification . . . 110, 111, 114, 132
latent outcomes 106, 109, 112, 114, 122, 127, 128
marginal effects examples 122–128
marginal effects formulas 122
motivation is for missing values 112
normality assumption 110
not generalization of two-part models 111
three interpretations 122
`generate` command 32, 102
GLM 1, 2, 4, 71–91
assumptions 73–74
compared with log models . . 78, 91, 93, 99–100
consistency 75
count data 73
dichotomous outcomes 73
distribution family . . 73–75, 85, 89, 91

GLM, *continued*
framework 73–75
generalization of OLS 72
healthcare expenditure example 75–77
heteroskedasticity 72, 73, 91
identity link problems 87
incremental effects 75, 81–85
index function 73
interaction term example . . . 78–81
inverse of link function 73
iteratively reweighted least squares 75
link function 72–75, 85, 91
link function test 87–89
log link 100
marginal effects 75, 81–85
parameter estimation 75
Park test, modified 89–90
Poisson models 138
prediction example 77–78
quasi–maximum likelihood 75
square root link 77, 86, 87
tests for link function and distribution family 85–90
two-part model, second part in 107, 108, 112, 116, 119
`glm` command 77, 82, 91, 132
GMM 1, 216–218
endogeneity 216–218
example of 2SLS 216
Hansen's J test 218
multiple equations 218
multiple instruments 217
overidentification test 218
standard errors different for 2SLS 216
`gmm` command 219
`gmm` option 216, 219
graphical checks . . . . . *see* visual checks

graphical tests 2
`grc1leg` command 69

H
Hansen's J test 218
health econometric myths 4–5
healthcare expenditure example, GLM 75–77
healthcare expenditures . . 1, 2, 4, 7, 16, 23, 26, 72
skewed 72, 173
zero, mass at 105
`heckman` command 113, 132
Heckman selection models 109–111
censoring assumption 109
censoring formulas 109
comparison of FIML and LIML . . 111
comparison with two-part models 111–116
example comparing with two-part model 122–128
examples showing similar marginal effects to two-part models 112–116
FIML and LIML 110–111
formula for FIML 110
formula for LIML 110
formulas 109–110
marginal effects examples 122–128
marginal effects formulas 122
motivation is for missing values 112
not generalization of two-part models 111
three interpretations 122
`heckprob` command 132
heterogeneous treatment effects . . . . . *see* treatment effects, heterogeneous
heteroskedasticity 2
GLM 72, 73, 91, 93
log models and retransformation 93, 99, 100
`histogram` command 32
Hosmer–Lemeshow test . . . *see* modified Hosmer–Lemeshow test

hurdle count models 149–155
compared with two-part models 149
compared with zero-inflated models 156
example of office visits 150
first and second parts 150
marginal effects 152–154
motivation 149

I

ignorability 10–12, 201
incremental effects 2, 16–18
design effects 221
example for Poisson model 141
FMM 183, 191
GLM 81–85
graphical representation 38–40
inconsistency in Poisson models 143
linear regression model 17
log models 99
nonlinear regression model 17
OLS 33, 36–38
Poisson models 140
two-part model formulas 119
two-part models 108–109
zero-inflated models 157
zeros, if mass at 105
inpatient expenditures 26
instrumental variables 201
assumptions 204
specification tests 206–207
weak instruments 204
intensive margin, two-part models 105, 119, 128
interaction term, GLM example . . 78–81
`intreg` command 132
inverse Mills ratio 110, 111, 123
`ivpoisson` command 216, 219
`ivprobit` command 219
`ivregress` command 205, 208, 209, 216, 219
`ivregress` postestimation commands 206, 219
`ivtobit` command 216, 219
`iweights` 223

J

J test . . . . . *see* Hansen's *J* test
jackknife
adjustment for clustering 227
intuition 227
standard errors 227
`jackknife` command 227
Jensen's inequality 96

K

K-fold cross-validation . . . . . *see* cross-validation
Kennedy transformation 95, 96
kurtosis, MEPS 26

L

latent outcomes
generalized tobit models 106, 109, 112, 114, 122, 127, 128
tobit models 129
LEF 136
negative binomial models are not LEF 145
negative binomial models with fixed α 145
Poisson models 136, 138
limited-information maximum likelihood . . . . . *see* LIML
LIML
comparison with FIML 111
formula for generalized tobit model 110
generalized tobit models . . 110–111
Heckman selection models 110–111
linear
exponential family . . . . . *see* LEF
regression models . . . . . *see* OLS
regression models mathematical formulation 34–35
link function test for GLM 87–89
`linktest` command 63, 70

`lnskew0` command 103
local linear regression . . . . . *see* nonparametric regression
log models 2, 5, 73, 91, 93–103
  compared with Box–Cox models 101
  compared with GLM 78, 91, 99–100
  dummy variable interpretation . . 95
  error retransformation factors . . 96–99
  estimation and interpretation . . 94–95
  formula 94
  healthcare expenditure example 94–95
  marginal and incremental effects 93, 99
  marginal effects affected by heteroskedasticity 99
  retransformation to raw scale . . 96–99
  two-part model, second part in 107
`logit` command 132, 163
logit models
  first part of
    hurdle count model 150
    two-part model . . . 107, 108, 112, 119
    zero-inflated model 156
  weighted formula 226
  weights 226

M

marginal effects 2, 16–18
  design effects 221
  example for Poisson model 141
  FMM 183, 191
  generalized tobit models 122
  GLM 81–85
  graphical representation 38–40
  Heckman selection models 122
  hurdle count models 152–154
marginal effects, *continued*
  inconsistency in Poisson models 143
  log models 93, 99
  log models affected by heteroskedasticity 99
  nonlinear regression model 17
  OLS 33, 36–38
  Poisson models 140
  two-part models 108–109
    formulas for 118–120
    similar to generalized tobit models 112–116
  zero-inflated models 157
  zeros, if mass at 105
`margins` command 36–38, 41–45, 70, 77–80, 82, 83, 91, 102, 117, 120, 125, 141, 146, 152, 153, 172, 178, 182, 189, 195, 197, 198, 233
`margins` postestimation command . . 91
`marginsplot` command 38, 70, 80, 91, 197
maximum likelihood estimation . . . . *see* MLE
`mean` command 229
median regression . . . . . *see* quantile regression
Medical Expenditure Panel Survey . . *see* MEPS
MEPS 2, 4, 23–32
  demographics 30
  expenditure and use variables . . 26–30
  explanatory variables 30–32
  health insurance 31

N

National Health Interview Survey . . 23, 224
natural experiments
cluster 225
weights 225
NB1
definition 145
example 146
linear mean 145
NB2
definition 145
example 146
quadratic mean 145
`nbreg` command 146, 163
negative binomial models . . . 5, 144–149
compared with Poisson models 145
conditional mean same as Poisson 145
consistency 145
examples 146–149
formula for density 144
formulas for first two moments 144
motivated by unobserved heterogeneity causing overdispersion 144
NB1 and NB2 145
robustness 145
second part of hurdle count model 150
truncated example 154
variance exceeds mean 145
zeros 145
negative binomial-1 . . . . . *see* NB1
negative binomial-2 . . . . . *see* NB2
`nlcom` command 181, 189
nonparametric regression 192–198
bootstrap 194
compared with parametric models 192
computation time 198
examples 193–198
local linear regression 193
normality
FIML sensitivity to assumption 123
generalized tobit assumption . . 110
OLS, not assumed by 108
tobit model assumption 129
`npregress` command 192–194, 200

O

OLS 1, 2, 4, 33–70, 72
  AIC and BIC 66–69
  assumptions 33
  ATE and ATET 41, 42
  best linear unbiased estimator . . 33
  can be inconsistent for count outcomes 133
  compared with median quantile regression 167
  endogeneity causes inconsistency 202–204
  examples of statistical tests . . 60–66
  graphical representation of marginal and incremental effects 38–40
  incremental effects 36–38
  log models . . . . . *see* log models
  marginal effects 36–38
  marginal effects compared with quantile regression 169
  mathematical formulation . . . 34–35
  misspecification
    consequences 34, 47–52
    exponential example 50–52
    quadratic example 47–49
  negative predictions 71
  regression with log-transformed dependent variable . . . . . *see* log models
  sample-to-sample variation . . 71, 72
  statistical tests 58–69
  treatment effects 41–46
  unbiased property 33
  visual checks 52–57
omitted variables 202, 207
  endogeneity, source of 201
ordinary least squares . . . . . *see* OLS
outliers 4
overdispersion
  problem for Poisson models . . . 142
  unobserved heterogeneity in negative binomial models 144
overidentification test, GMM 218
overidentifying restriction test, 2SLS specification test 207
oversampling 31

P

Park test, modified for GLM 89–91
`parmest` package 169
`poisson` command 163
Poisson models 5, 137–144, 231
  canonical count model 136
  compared with negative binomial models 145
  consistent if conditional mean correct 136, 139
  events underpredicted in tails . . 143
  example of office-based visits . . 139
  exponential mean specification 139
  formula 137
    for covariance matrix 138
    for semielasticity 139
  GLM objective function 138
  GMM 218
  incremental effects 140
    can be inconsistent 143
    example 141
  instrumental variables, by GMM 218
  interpretation 139–142
  interpretation as semielasticity 139
  LEF 138
  log-likelihood function 138
  marginal effects 140
    can be inconsistent 143
    example 141
  mean equals variance 137
  MLE 137–138
  motivation from exponential time between events 137
  overdispersion 142
  restrictiveness 142–144
  robust standard errors 142
  robustness 138–139, 159

Poisson models, *continued*
second part of hurdle count model 150
variance equals mean 137
weighted example 233–234
zeros underpredicted 143
population mean 226
potential outcomes 2, 7–13, 18, 35
causal inference 9
`predict` command 102, 184
prediction, GLM 77–78
Pregibon's link test 19, 58–60, 131
example 60, 61, 65
relation to RESET test 59
Stata command 63
primary sampling unit . . . . . *see* PSU
`probit` command 132, 163
probit models
comparison with tobit 130
first part of
hurdle count model 150
zero-inflated model 156
tobit model 128
two-part model, first part in . . 107–109, 111, 116, 119
PSU 223
bootstrap or jackknife 227
MEPS 224
`pweights` 223, 226

Q

`qcount` package 173
`qreg` command 169, 170, 200
quantile regression 3, 166–173
appealing properties 167
applied to count data 173
applied to nonlinear data-generating process 173
compared with OLS 167
effects of covariates vary across conditional quantiles of the outcome 167
equivariant to monotone transformations 167
examples 167–173
quantile regression, *continued*
extensions 173
formula 167
marginal effects compared with OLS 169
median regression 166
robust to outliers 167

R

Ramsey's regression equation specification error test . . . . . *see* RESET test
RAND Health Insurance Experiment . . v, 107
randomized trial 11, 12
`regress` command . . . 69, 102, 132, 208, 231
`regress` postestimation commands 53, 69
`replace` command 32
RESET test 19, 58–59, 131
example 60–62, 65
generalization of Pregibon's link test 59
Stata command 63
retransformation 73, 93, 99
general theory of Box–Cox under homoskedasticity 101
robustness, negative binomial models 145
`rvfplot` command 53, 69
`rvpplot` command 53, 69

S

sampling weights . . . . . *see* weights
`scatter` command 32
selection
attrition 221, 225
models 2, 5
on unobservables 13, 21
self-selection 12
single-index models that accommodate zeros 106, 128–131
GLM 131
nonlinear least squares 131

single-index models that accommodate zeros, *continued*
one-part models . . . 131
tobit models . . . 128–130
skewed data . . . 72
skewness . . . 2–4, 71
Box–Cox targets skewness . . . 101
count models . . . 133
GLM . . . 91
MEPS . . . 26–28
OLS errors . . . 72
skewness transformation, zero . . . 102
specification tests . . . 18
2SLS . . . 206–207
balance test . . . 207
exogeneity test . . . 206
F test . . . 206
instrument strength test . . . 206
overidentifying restriction test . . . 207
`sqreg` command . . . 169, 171, 200
square root model . . . 101
square root transformation
GLM . . . 77, 87
square root transformation GLM . . . 86, 87
`ssc install`
`fmm9` command . . . 200
`parmest` command . . . 169
`twopm` command . . . 132
standard errors
2SLS versus GMM . . . 216
2SLS versus OLS . . . 206
bootstrap . . . 227
delta method . . . 41, 227
design effects . . . 221, 226–227
difference-in-differences . . . 222
formula with clustering . . . 224
GMM correct standard errors for 2SRI . . . 217
jackknife . . . 227
`margins` and `teffects` command . . . 45
Poisson models . . . 142

statistical tests 70
stratification 235
study design 235
summary statistics 32
survey design 235
treatment effects 70
two-part models 132
weights 235
zero-inflated models 163
statistical tests 2
OLS 58–69
OLS examples 60–66
stratification 223–224
affects standard errors 225
purpose 224
study design . . . . . *see* design effects
`suest` command 152
`summarize` command 32, 229
survey design . . . . . *see* design effects
`svy` prefix command . . 91, 228–231, 235
`svy bootstrap` command 227
`svy jackknife` command 227
`svyset` command 227, 228, 235

T

`tabstat` command 32
Taylor series, linearization for standard errors 227, 228
`teffects` command 41–45, 70
`test` command 70
`testparm` command 70
`tnbreg` command 163
`tobit` command 132
tobit models 128–130
censoring 129
censoring assumption 129, 130
comparison with probit 130
formulas 129
homoskedasticity assumption . . 130
latent outcomes 129
MLE formula 129
tobit models, *continued*
normality assumption 129, 130
restrictive assumptions 130
right-censored example 130
truncation of positive values at zero 130
why used sparingly 130
tobit, generalized . . . . . *see* generalized tobit models
`tpoisson` command 151, 163
treatment effects 2, 8–10, 12, 17
clustering 225
covariate adjustment 12–13
difference-in-differences 225
endogeneity 201
heterogeneous 3–5, 165–200
linear regression 13–15
nonlinear regression 15–16
OLS 33, 41–46
on not-treated 140
randomization 11–12
regression estimates 13–16
zeros, if mass at 105
`treatreg` command 132
truncation
comparison with censoring 129
count models 158–159
definition 129
formulas 159
left-truncation 158
right-truncation 158
zero-truncation 158
two-part models . . . . . v, 2, 5, 106–109
actual outcomes 106, 116, 122, 128
choices for first-and second-parts 107
compared with hurdle count models 149
comparison with generalized tobit models 111–116
comparison with Heckman selection models 111–116

two-part models, *continued*
example
comparing with generalized tobit model 122–128
comparing with Heckman selection model 122–128
with MEPS 116–118
examples showing similar marginal effects to generalized tobit models 112–116
expected value of y 108–109
formula,
general 106
logit and GLM with log link . . 108
probit and homoskedastic nonnormal log model 109
probit and homoskedastic normal log model 109
probit and linear 108
probit and normal 108
probit and GLM with log link 108
formulas for incremental effects 119
history 107
marginal and incremental effects 108–109
marginal effect example . . . 120–121
marginal effect formulas . . 118–120
mixture density motivation 112
motivation is for actual zeros . . 112
not nested in generalized tobit models 111
relation to CDE 199
statistical decomposition 106
statistical tests 131
two-stage least squares . . . . . *see* 2SLS
two-stage residual inclusion . . . *see* 2SRI
`twopm` command 113, 116, 117, 120, 132, 152
`twostep` option 219

V
`vce(cluster)` option 223, 224, 227, 235
`vce(robust)` option 142
visual checks
artificial-data example 52–55
MEPS example 55–57
OLS 52–57
Vuong's test 148, 160

W
weak instruments . . . . . *see* instrumental variables
weighted least squares . . . . . *see* WLS
weighted sample means, example . . 229–231
weights 223
affect point estimates and standard errors 225
analytic weights, `aweights` 223
definitions 223
effect on point estimates 226
effect on regression coefficients 221
frequency weights, `fweights` . . 223
importance weights, `iweights` 223
in natural experiments 225
logistic regression 226
population mean 226
population weights 223
postsampling weights 223, 225
sampling weights 223
`pweights` 223
with bootstrap or jackknife . . 227
WLS 226
WLS 226
example 231–233
formula 226

Z
zero-inflated models 149, 155–158
compared with hurdle count models 156
example for office-based visits . . 156
